

PRESSURE LIMITING VALVE

Valves for braking systems

TOWED VEHICLES |

The **High-flow pressure limiting** valve is expressly developed for RVBR trailer applications.

The valve has been designed for a huge oil flow thus to **respect all response time requirements**.

The valve can be used for several functions within the brake system.

One of such functions can be, for example, to **limit the risk of rear axle wheel to lock**, or even to **prevent excessive mechanical stress related to the use of too high pressure**.

The valve can be **supplied already set** and protected by an **Anti-Tampering System** of the setting or in a **version to be configured** on the vehicle.
